
INSTALLATION INSTRUCTIONS

Fill Master Fill Cycle Diverter

The Fill Master™ Fill Cycle Diverter saves 1/2 to 1-1/2 gallons of water per flush. The Fill Master™ diverts the majority of water that would normally flow down the toilet overflow tube back into your toilet tank during the toilet's filling cycle. Tune your toilet to prevent excess water from needlessly flowing down the drain. Saves water and money by making your toilet more efficient!

Instructions:

- Step 1: Pull hose loose from overflow tube.
- Step 2: Remove clip or holder from hose.
- Step 3: Insert Fill Master™ into end of hose.
- Step 4: Push Fill Master™ onto overflow tube with nozzle #1 inside the tube and nozzle #2 and #3 outside the tube.
- Step 5: Hose may need to be cut shorter for proper fit.
- Step 6: Position nozzle #2 or #3 into the tube as needed if the bowl does not fill to its normal level when flushed.
